**\* Severity ratings correspond to the following categories:**

**Slight** = includes one or more but not necessarily all of the following: leaves may show puckering and/or crinkling over several nodes; small, newly emerging leaves may have a cupped (mouse ear) appearance; there is no visible reduction in plant height or canopy volume.

**Moderate** = includes one or more but not necessarily all of the following: leaves exhibit puckering and/or crinkling as well as more pronounced malformations such as "drawstring" symptoms; a cupped or turtle back appearance and leaves may be reduced in size; affected plants continue to produce new leaves though they may be malformed for several nodes; compaction of nodal development is evident or there is a more compact growth rate in the terminal.

**Severe** = includes one or more but not necessarily all of the following: emergence of new leaves has either been terminated or drastically reduced; new growth at the growing points, including the main-stem terminal, consists of miniature leaves and may be stacked and may appear in a rosette pattern; termination or restriction of growth at all growing points in the plants.
